RECAP

What is the problem?

The Problem

1. Imagine we have N nodes, and all nodes are a separate set initially.
2. Now, we get queries of 2 kinds:
 - a. Combine the corresponding sets of 2 given nodes.
 - b. Given 2 nodes, check whether they are in the same set or not.

$N = 6 \Rightarrow \{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}$

$\text{combine}(1, 4) \Rightarrow \{1, 4\}, \{2\}, \{3\}, \{5\}, \{6\}$

$\text{check}(1, 2) \Rightarrow \text{false}$

$\text{combine}(4, 2) \Rightarrow \{1, 2, 4\}, \{3\}, \{5\}, \{6\}$

$\text{check}(1, 2) \Rightarrow \text{true}$

Come on, come up with some ideas

A Possible Way

nodes

ref

$\text{union}(1, 4)$

$\text{find}(1, 2) \rightarrow f$

$\text{union}(2, 4)$

$\text{find}(1, 2) \rightarrow t$

$\text{union} \Rightarrow O(N)$

$\text{find} \Rightarrow O(1)$

1, 1, 1, - - - 1 \Rightarrow 1

(2, 1), 1, - - - 1 \Rightarrow 2

3, 1, - - - 1 \Rightarrow 3
⋮

$$\Rightarrow \frac{n * (n-1)}{2} \Rightarrow O(N^2)$$

Small to Large Merging

Consider a node x

$$2^t \leq N$$

$$t \leq \log_2 N$$

$$1 \text{ element} \Rightarrow \log_2 N$$

If all elements \Rightarrow not more than $N * \log_2 N$ transfers

Let's implement this

Can we do better?
Can trees help?

$un(1, 3)$
 $un(3, 2)$

	1	2	3	4	5	6	7		N
par	1	1	1	1	4	6	7	- - - -	N

Optimisation 1 - Path Compression

→ Avg.
↓
 $O(\log N)$

Optimisation 2 - Union by Size

If 1 & 2, both are done

↳ Time = inverse ackermann func $\Rightarrow \alpha(N)$

almost $O(1)$
(amortized)

$$\alpha(N) \leq 4$$

$$\forall N \leq 10^{600}$$

Let's implement

Drawback?

The connections, once made, can't be reversed.

Practice

Find num. of
components
efficiently

0. Warm Up

Possible way :

```
int cut = 0;
```

```
for (i = 1 to n) {  
    if (par[i] == i)  
        cut++;  
}
```

```
}
```

```
return cut;
```

$O(N)$
time

Thank You!

Reminder: Going to the gym & observing the trainer work out can help you know the right technique, but you'll muscle up only if you lift some weights yourself.

So, PRACTICE, PRACTICE, PRACTICE!
